# CIRCUIT DESCRIPTION

## 1) Receiver System

### 1. Receiver system :

Triple Superheterodyne Conversion (NFM,AM)

Double Superheterodyne Conversion (WFM)

1st IF :243.95MHz

2nd IF :39.15MHz (NFM,AM)

2nd IF :10.7MHz (WFM)

3rd IF :450kHz (NFM,AM)

### 2. Front end

[0.100-29.995MHz]

The incoming signal from the bar antenna goes to band switch circuitry (Q302, D306).

The bar antenna covers 2 bands, SW and MW, which can be selected with a switching circuitry Q302 and D306.

The signal goes to the first RF amplifier (Q301) and passes through a low-pass filter, followed by the second RF amplifier (IC307). Then the signal goes to the common mixer (IC304).

[30-136.995MHz]

The incoming signal from the antenna passes through a band-pass filter and goes to the first amplifier (Q318).

Then the signal goes to the common mixer (IC304).

[137-222.995MHz]

The incoming signal from the antenna passes through a band-pass filter and goes to the first amplifier (Q316). Then the signal goes to the common mixer (IC304).

[223-367.995MHz]

The incoming signal from the antenna passes through a band-pass filter and goes to the first amplifier (IC307). Then the signal goes to the common mixer (IC304).

[368-469.995MHz]

The incoming signal from the antenna passes through a band-pass filter and goes to the first amplifier (Q322). Then the signal goes to the common mixer (IC304).

[470-849.995MHz]

The incoming signal from the antenna passes through a band-pass filter and goes to the first amplifier (IC307). Then the signal goes to the common mixer (IC304).

Note that the cellular-phone band block system is mentioned on the separated sheet for the T-version.

[850-1299.995MHz]

The incoming signal from the antenna passes through a band-pass filter and goes to the first amplifier (IC307). Then the signal goes to the common mixer (IC304).

### 3. Mixer

[The 1st Mixer]

The 1st local oscillator signal for the 1st mixer is supplied from the VCO.

The signal heterodowned to the 1st IF of 243.95MHz by the mixer passes through a SAW filter (FL302) and unwanted signal components are eliminated.

[The 2nd Mixer]

The 2nd local oscillator signal for the 2nd mixer is supplied from the VCO.

In FM/AM mode, the signal heterodowned to the 2nd IF of 39.15MHz by the mixer passes through a crystal filter (FL301) and unwanted signal components are eliminated.

The resulting signal is amplified by the 2nd IF amplifier Q317 and goes to the IF IC (IC309).

In WFM mode, the signal heterodowned to the 2nd IF of 10.7MHz by the mixer passes through a ceramic filter (FL303) and unwanted signal components are eliminated.

The resulting signal is amplified by the IF amplifier Q319 and goes to the IF IC (IC309).

#### [The 3rd Mixer ]

The 3rd local oscillator signal for the 3rd mixer is 38.7MHz signal that is produced by multiplying the 12.9MHz (X301) oscillator output with a multiplier (Q314).

### 4. IF

#### [FM]

In FM mode, the signal passes through an external ceramic filter (FL304) and FM/AM switch (D342), and goes back to the IF IC (IC309).

The signal is amplified by the internal IF amplifier is demodulated by the quadrature FM demodulation circuit using a coil (L345) and output as an AF signal.

#### [AM]

In AM mode, the signal passes through an external ceramic filter (FL304) and goes back to the IF IC (IC309). The 2nd IF amplifier Q317 is controlled by reverse AGC at AGC amplifier Q325 to get better audio output even though the input is changed, and the gain is controlled.

#### [WFM]

In WFM mode, the signal of 10.7MHz passes through FM/AM switch (D342) and goes to the IF IC (IC309). The signal is amplified by the internal IF amplifier is demodulated by the quadrature FM demodulation circuit using a coil (L342) and output as an AF signal.

### 5. Squelch

The AF signal got from pin 12 of IF IC (IC309) is fed to pin 19 of IF IC (IC309). The input signal is output from pin 21 of IF IC (IC309) passing through the noise filter amplifier and rectifier circuits inside of IF IC (IC309). The rectified signal is added to the A/D port of the microcomputer (IC308). Judging the signal, the microcomputer controls ON/OFF of the audio output.

### 6. Audio

#### [FM/AM/WFM]

The AF signal goes to the switching IC (IC310). The switched signal passes through active filter (Q340) and goes to the electronic volume (IC314, Q330).

The adjusted signal goes to the AUDIO IC (IC313) and drives a speaker, etc.

### 7. VCO

#### [The 1st Local]

The VCO for the 1st local consists of the Colpitts oscillator. D310, D311 and L302 determine the frequency, and they are oscillated at the transistor Q303. The oscillated signal passes through the buffer amplifiers (Q304, Q306) and goes to the PLL-IC (IC302).

#### [The 2nd Local]

The VCO for the 1st local consists of the Colpitts oscillator. D321, D324 and L311 determine the frequency, and they are oscillated at the transistor Q313. The oscillated signal passes through the buffer amplifier (Q315) and goes to the PLL-IC (IC302).

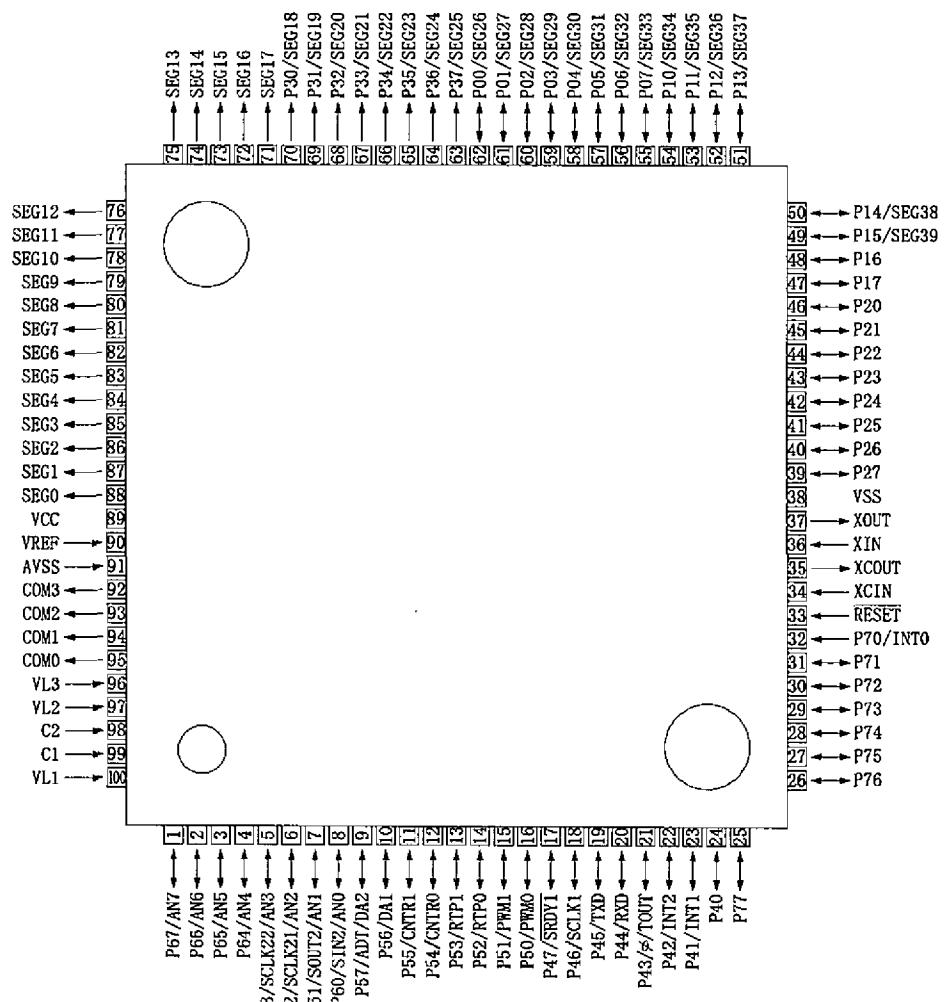

### 8. PLL

PLL-IC (IC302) is used to control the oscillation frequency of VCO. The microcomputer (IC308) sends the signal with serial data to PLL-IC (IC302). The 12.9MHz reference frequency of PLL-IC (IC302) oscillates the crystal oscillator X301 at the external circuit (IC303).

## 2) Entering And Releasing The Adjustment Mode

The DJ-X7 does not require a serviceperson to manipulate the components on the printed-circuit board, except the trimmer when adjusting reference frequency and deviation. Most of the adjustments for the transceiver are made by using the keys on it while the unit is in the adjustment mode. Because the adjustment mode temporarily uses the channels, frequency must be set on each channel before adjustments can be made. For instructions on how to program the channels, see the "DJ-X7 INSTRUCTION MANUAL" which came with the product. In consideration of the radio environment, the frequency on each channel must be near the value (+/-1MHz) listed in the table below. To enter the adjustment mode, set key lock and press [BAND], [V/P/M], [SCAN], [V/P/M], [SCAN], [BAND], and [10M/1M] key. "Freq" appears in LCD. When changing the adjustment parameters, press the [SCAN] or [BAND] key.

To exit the adjustment mode, press the [MONI] key.
